WHY WE USE AWS

- Fast hardware (service) provisioning

- Easy scale up/down/in/out

- Pay only for resources you need

GLOSSARY

- RDS - Relational Database Service

- EC2 - Elastic Compute Cloud

- EBS - Elastic Block Store

- S3 - Simple Storage Service

- ELB - Elastic Load Balancing

- AZ - Availability Zone

- ASG - Auto Scaling Group

zalando

POSTGRESQL HA ON AWS

- Shared storage - **EBS,** attach it to a different **EC2** Instance
  - Works within one **AZ**
- Storage mirroring - **Multi-AZ RDS** (**EBS** is replicated to another **AZ**)
  - Works between **AZ**
  - Replicas can't execute queries
- Streaming replication - you can start additional **RDS** replicas
  - Works between **AZ**
  - Replicas can execute queries
  - Automatic Failover problem (if not **Multi-AZ** deployment)

zalando

EC2 VS. RDS: PRICING*

Instance Type	RDS	EC2
(db.)t2.micro	$18/month	$10/month
(db.)t2.small	$32/month	$20/month
(db.)t2.large	$122/month	$78/month
(db.)m4.large	$158/month	$87/month
(db.)m4.xlarge	$317/month	$175/month

* storage price is not included

zalando

EC2 VS. RDS: PRICING*

Instance Type	RDS Multi-AZ	2 x EC2 + ELB**	3 x EC2 + ELB**
(db.)t2.micro	$36.0/month	$41.8/month	$51.8/month
(db.)t2.small	$64/month	$60.5/month	$79.9/month
(db.)t2.large	$244/month	$177.1/month	$254.9/month
(db.)m4.large	$316/month	$194.4/month	$280.8/month
(db.)m4.xlarge	$634/month	$367.2/month	$540.0/month

* storage price is not included   ** ELB - ~$21/month

zalando

RDS SUMMARY

- No superuser access

- No replication connection

- No custom extensions

- Either you run **Multi-AZ RDS** deployment (replica can't receive queries)

- Or **Master** + **Replica** on **RDS** and don't have automatic failover

zalando
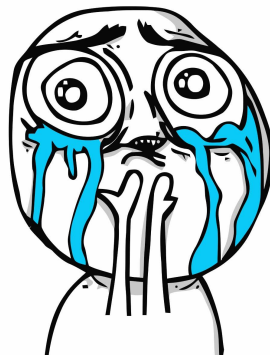

SPILO AND PATRONI

- **Patroni** - High-Availability and automatic failover

- **Spilo** - Docker package of Patroni and WAL-E for AWS or Kubernetes

- Use CloudFormation stacks and ASG for deployments

- One Docker container per EC2 Instance

- ELB for traffic routing
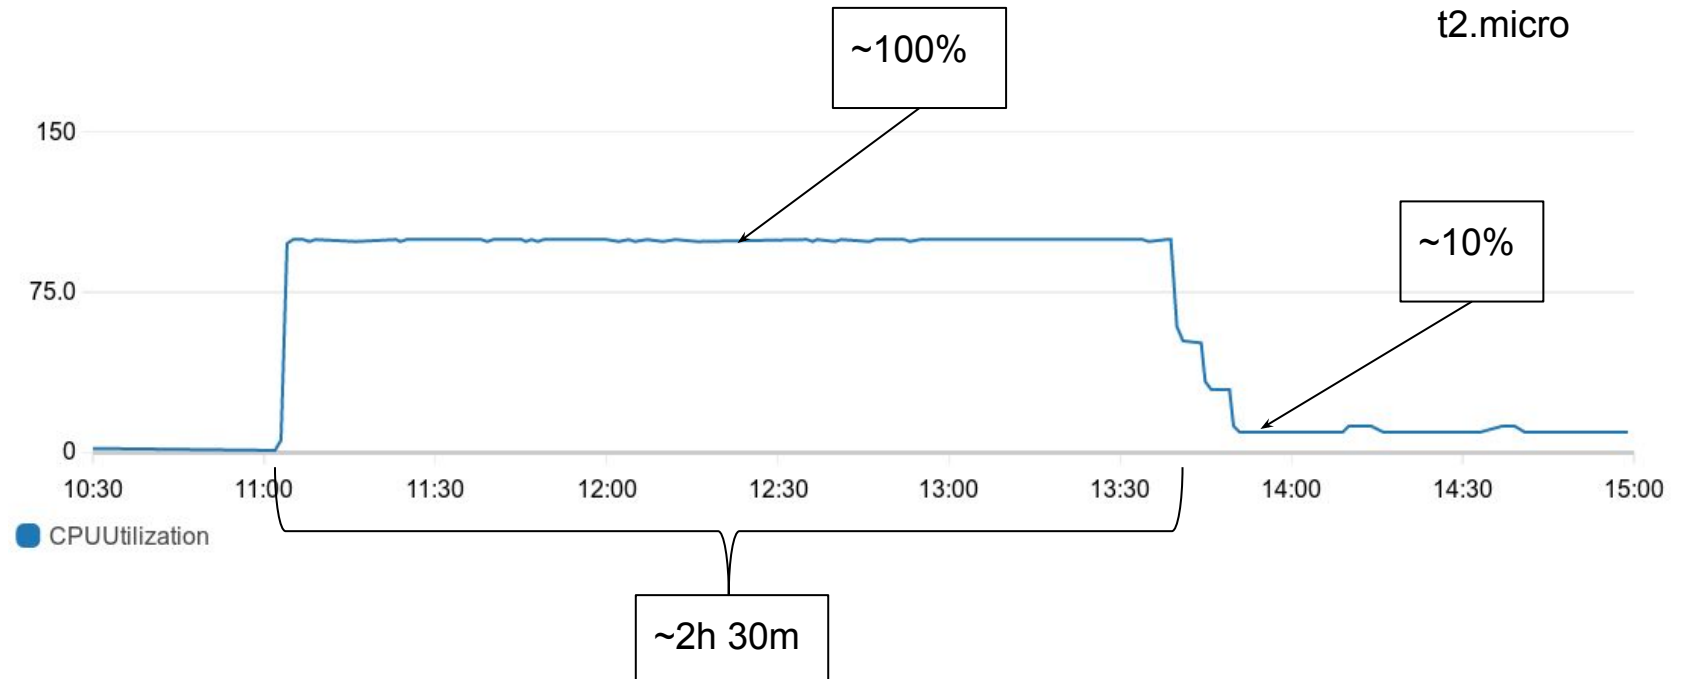

zalando

AWS DEPLOYMENT
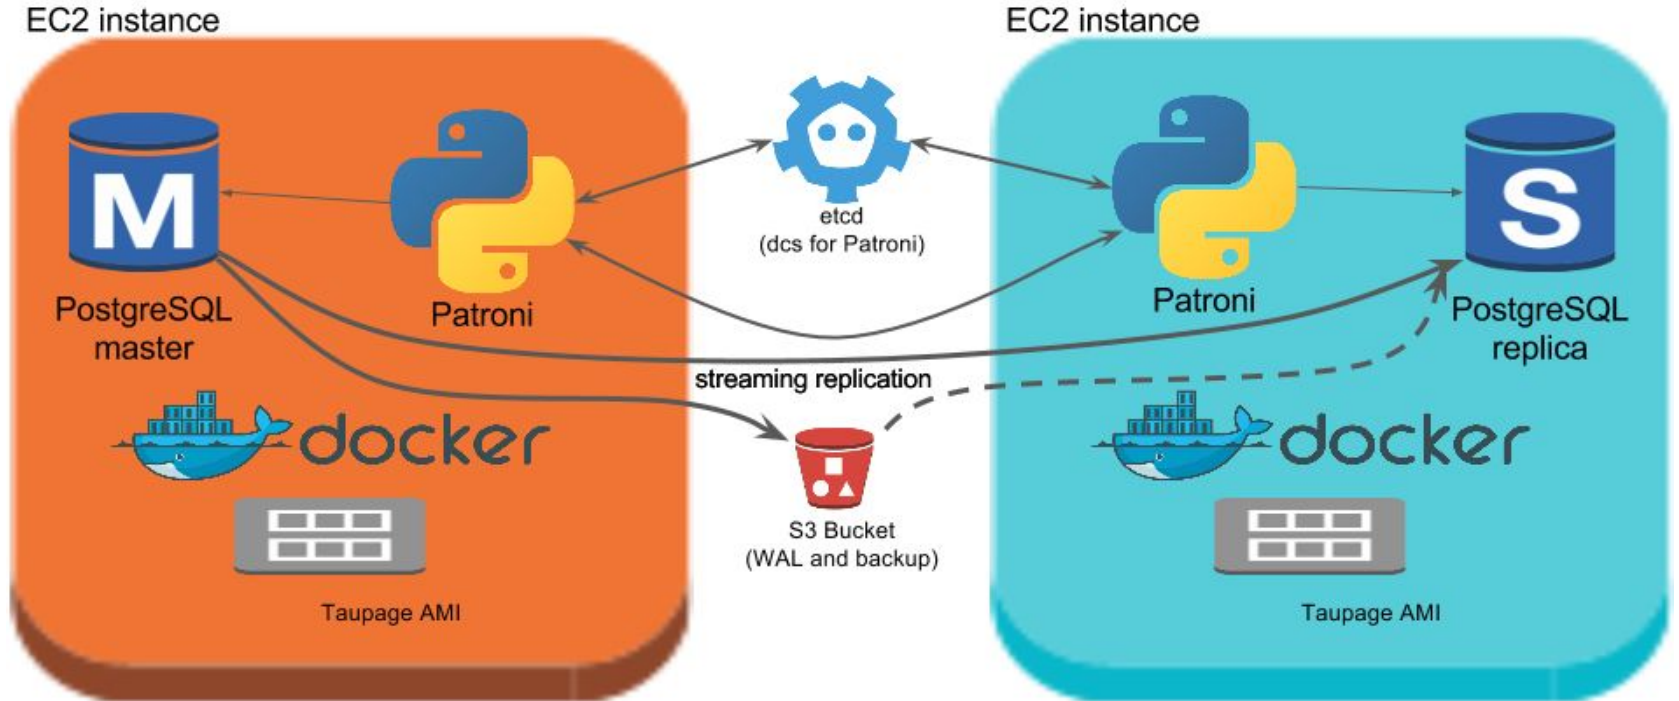

EC2 INSTANCE FEATURES

- Instance Types: t2, m4, c4, x1, r4, p2, g3, f1, i3, d2

- Instance Sizes: nano, micro, small, medium, large, xlarge, 2xlarge, 4xlarge, 10xlarge, 16xlarge, 32xlarge

- Performance: Fixed vs. Burstable (T2 Instances)

- Storage: Instance Store (Ephemeral) vs. EBS

- EBS-optimized Instances

- Enhanced Networking

zalando

BURSTABLE PERFORMANCE

OR WHY IS MY DATABASE

VERY SLOW?

BURSTABLE PERFORMANCE

t2.micro

~100%

~10%

~2h 30m

zalando

BURSTABLE PERFORMANCE

t2.micro

T2 INSTANCES

- Designed to provide moderate baseline performance and the capability to **burst** to significantly higher performance as required by your workload.
- If your account is less than 12 months old, you can use a t2.micro instance for **free** within certain usage limits.

Instance Type	Initial CPU credit	Credits earned per hour	vCPUs	Base performance (CPU utilization)	Max CPU credit balance
t2.micro	30	6	1	10%	144
t2.small	30	12	1	20%	288
t2.medium	60	24	2	40%	578
t2.large	60	36	2	60%	864

zalando

CPU CREDITS

- One CPU credit is equal to one vCPU running at 100% utilization for one minute.
- When a T2 instance uses fewer CPU resources than its base performance level allows (such as when it is idle), the unused CPU credits (or the difference between what was earned and what was spent) are stored in the credit balance for up to 24 hours, building CPU credits for bursting.
- When a T2 instance requires more CPU resources than its base performance level allows, it uses credits from the CPU credit balance to burst up to 100% utilization.
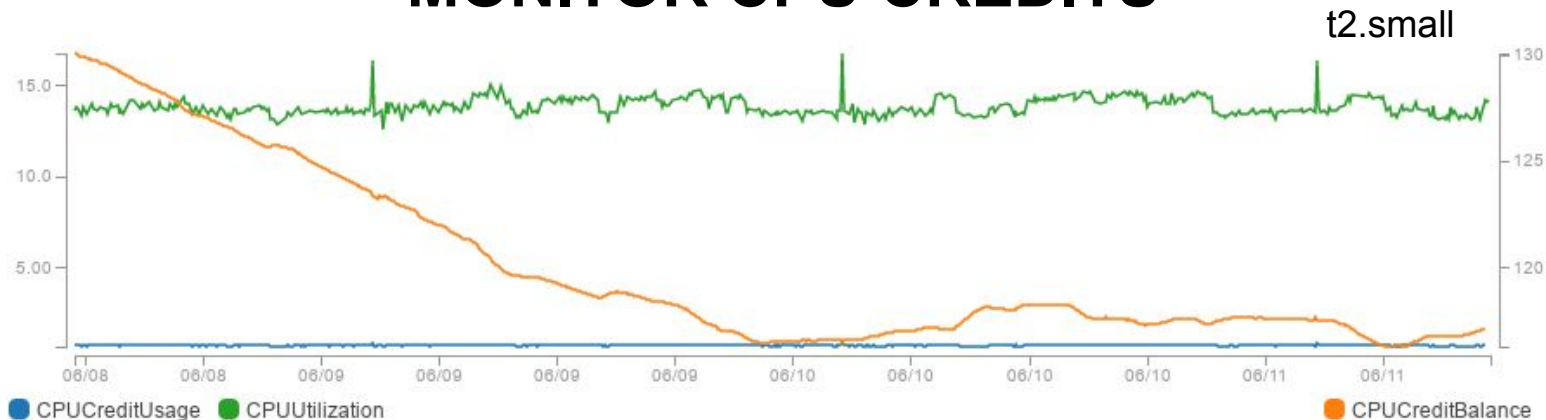

zalando

HORROR STORY

- WAL-E wal-fetch/wal-prefetch is terribly slow
  - Prefetch spawns 8 worker processes (by default) and can burn all CPU Credits

How we solved it:
1. use "-p 0" to disable prefetch
2. reimplemented 'wal-fetch' in bash + curl + openssl

zalando

MONITOR CPU CREDITS

t2.small

- **CPUCreditUsage** metric indicates the number of CPU credits used during the measurement period

- **CPUCreditBalance** metric indicates the number of unused CPU credits a T2 instance has earned

zalando

RESERVED INSTANCES

- 1 year or 3 year contracts

- Significant discount compared to On-Demand instance pricing

- Capacity reservation

- Customers using both Reserved and On-Demand instances will have

  Reserved Instance rates applied first to minimize costs

zalando

RESERVED INSTANCES

| m4.large, Standard 1-Year Term					
Payment Option	**Upfront**	**Monthly**	**Effective Hourly**	**Savings**	**On-Demand Hourly**
No Upfront	$0	$59.79	$0.082	32%	
Partial Upfront	$342	$28.47	$0.078	35%	$0.12
All Upfront	$670	$0	$0.076	36%	
m4.large, Standard 3-Year Term					
No Upfront	$0	$44.17	$0.061	50%	
Partial Upfront	$736	$20.44	$0.056	53%	$0.12
All Upfront	$1383	$0	$0.053	56%	

* Frankfurt region

zalando

SPOT INSTANCES

- Bidding on "AWS overcapacity"

- Variable price point, save up to 90% vs. on-demand

Risks

Unavailability or loss of instance if outbid!!!

zalando

SPOT MARKET
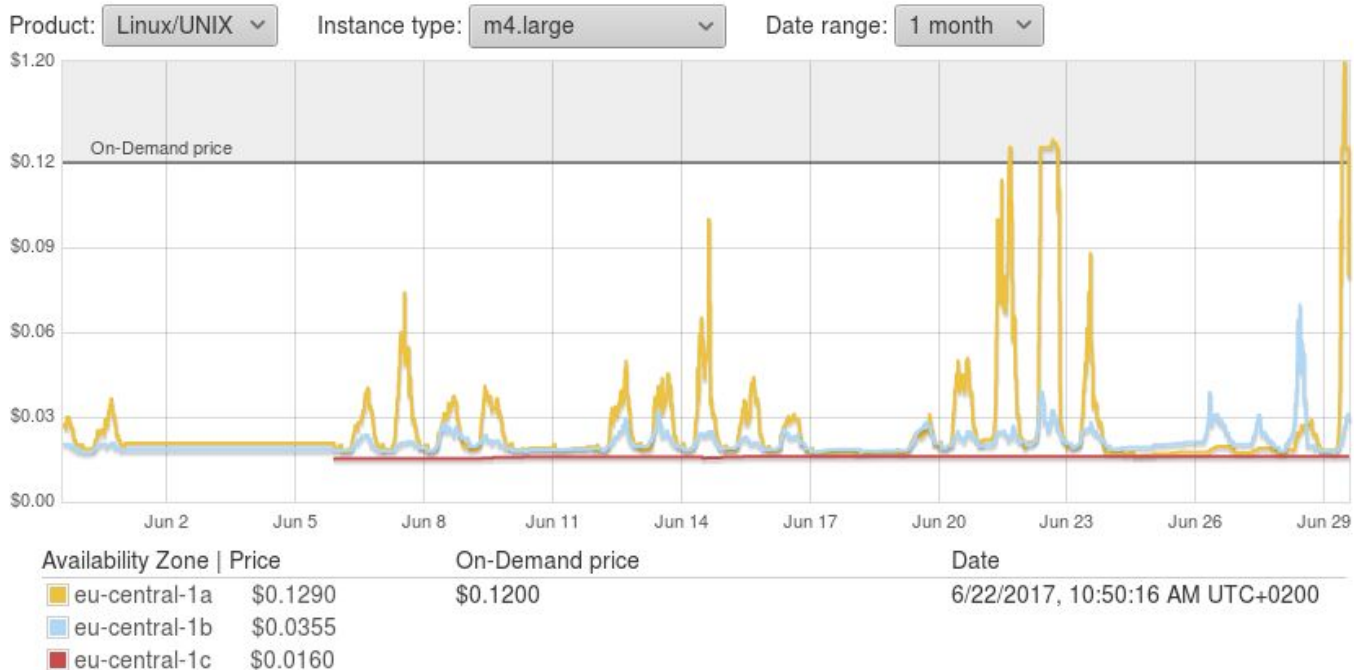

USE CASES

Everything that can fail or be unavailable for short duration

- Async processing

- Reporting

- CI

- Staging systems

- Testing of backups

zalando

HORROR STORY

- There were only 2 AZ in eu-central-1 until June 2017

- ASG is trying to do its best to distribute resources across different AZ, but when **Spot Price** is high, it might happen that two EC2 Instances will run in the same AZ

- When price will go down, ASG will rebalance resources, i.e. spawn a new instance in another AZ and terminate one of the running instances

- With 50% probability it will kill the "master"

How we solved it:

AutoScalingGroup -> "TerminationPolicies": ["NewestInstance", "Default"]

zalando

ELASTIC BLOCK STORE

Name	io1	gp2	st1	sc1
Size	4GB - 16TB	1GB - 16TB	500GB - 16TB	500GB - 16TB
Max IOPS/Volume	20000	10000	500	250
Max Throughput/Volume	320MB/s	160MB/s	500MB/s	250MB/s
Price	$0.149/GB-month $0.078/provisioned IOPS	$0.119/GB-month	$0.054/GB-month	$0.03/GB-month

zalando

ELASTIC BLOCK STORE

- ST1 and SC1 - HDD, good throughput, but low IOPS

- GP2 and IO1 - SSD, usually good choice for databases

- EBS volumes are created in a specific AZ, and can then be attached to

  any instances in that AZ

- IOPS and throughput depends on Volume Size

zalando

IO1 VS. GP2

- IO1 gives better IOPS guarantees

- But you have to pay for it – the same size costs 25% more. Plus you
  have to pay for provisioned IOPS

- For RDS minimum size of IO1 volume is 100 GB + 1000 provisioned
  IOPS. It will cost you $13.80 + $110 per month

- You can get 1000 IOPS with 334 GB GP2 volume for $42/month

zalando

SEQUEL:

BURSTABLE PERFORMANCE
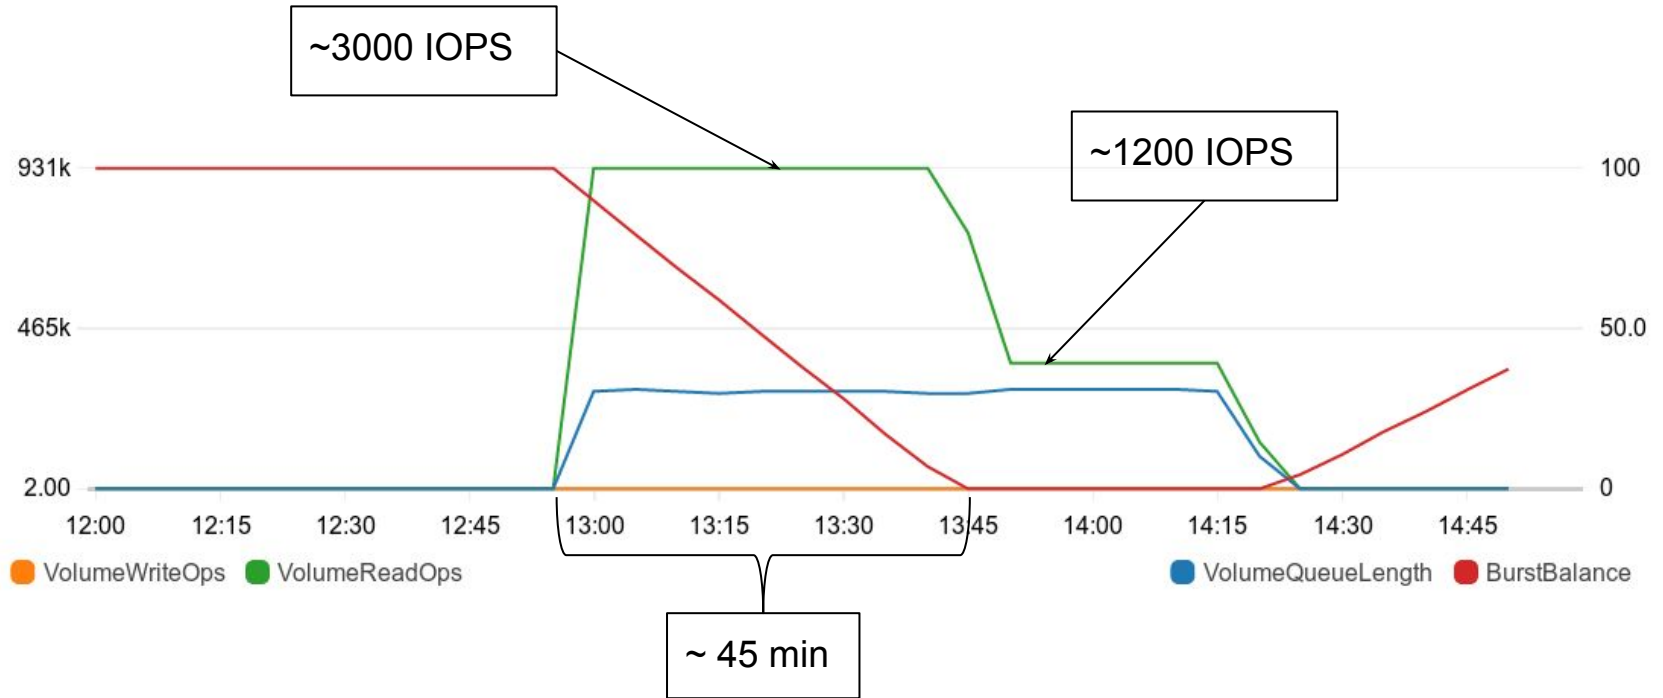

OR WHY IS MY DATABASE

SLOW AGAIN?

zalando

BURSTABLE PERFORMANCE

400 GB Volume

~3000 IOPS

~1200 IOPS

~ 45 min

zalando
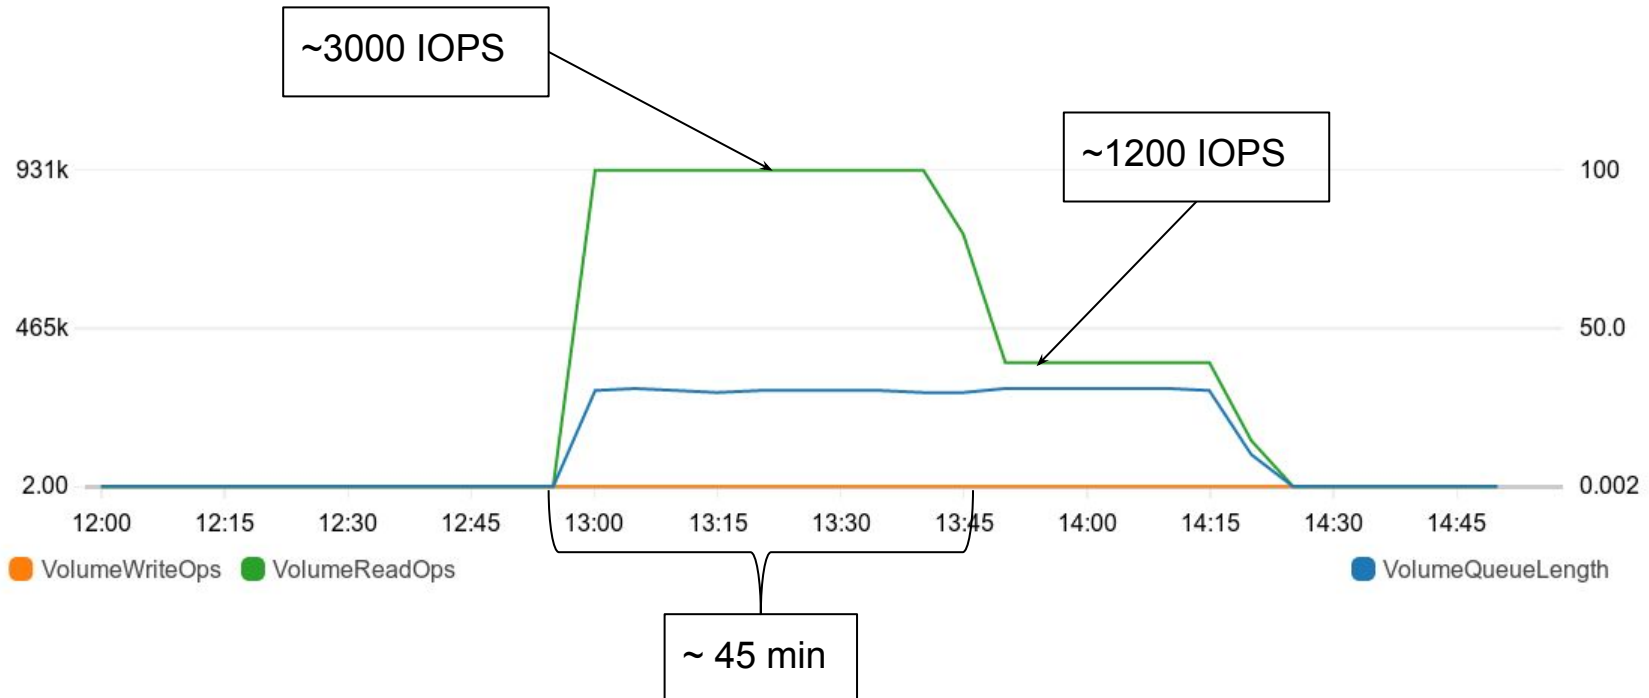

# BURSTABLE PERFORMANCE

400 GB Volume

I/O CREDITS AND BURST PERFORMANCE

- The performance of gp2 volumes is tied to volume size (3 IOPS/GiB)
- The maximum and initial I/O credit balance for a volume is 5.4 million
- When your volume requires more than the baseline performance I/O level, it draws on I/O credits in the credit balance to burst to the required performance level, up to a maximum of 3,000 IOPS
- When your volume uses fewer I/O credits than it earns in a second, unused I/O credits are added to the I/O credit balance

zalando

GP2 VOLUMES EXPLAINED
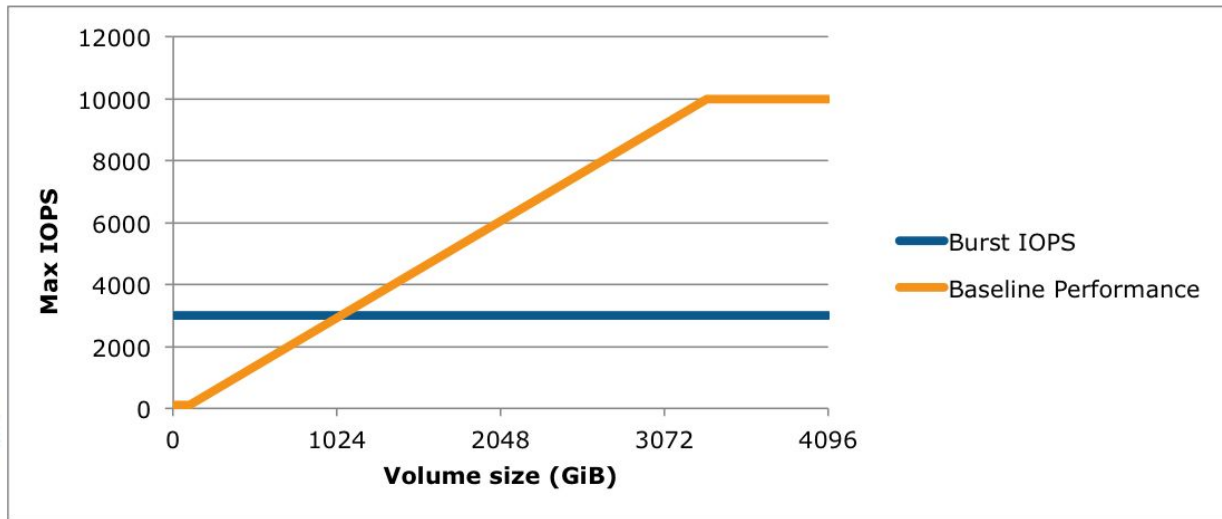

MONITOR I/O WITH CLOUDWATCH

500 GB Volume
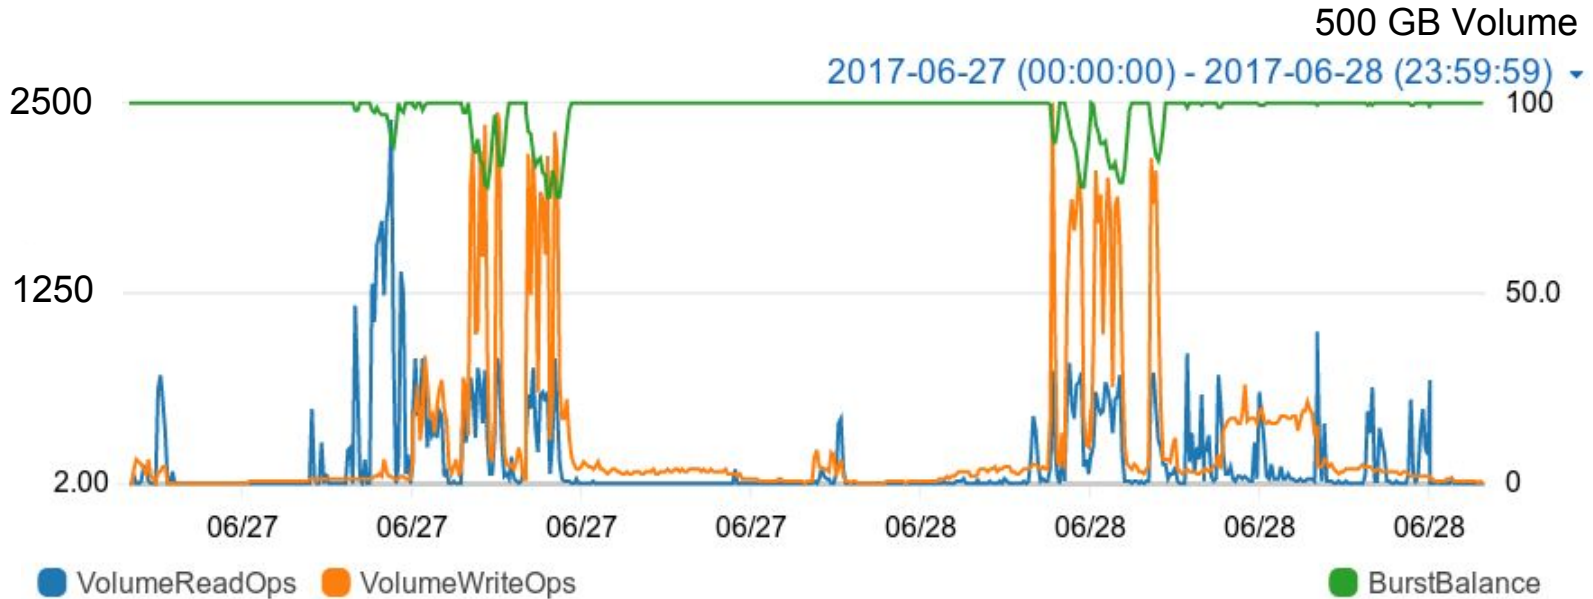

- Especially **BurstBalance** if GP2 volume is smaller than 1TB

EBS-OPTIMIZED INSTANCES

- Dedicated bandwidth to Amazon EBS, with options between 500 Mbps and 12,000 Mbps, depending on the instance type you use

- Provides the best performance for your EBS volumes by minimizing contention between Amazon EBS I/O and other traffic from your instance

zalando

EBS THROUGHPUT

InstanceType	vCPU	Memory	Max IOPS	Throughput (Mb/s)	Price (per month)
m4.large	2	8 GB	3600	56.25	$87.6
r4.large	2	15 GB	3000	54	$116.8
m4.xlarge	4	16 GB	6000	93.75	$175.2
r4.xlarge	4	30 GB	6000	109	$233.6
m4.4xlarge	16	64 GB	16000	250	$700.7
r4.4xlarge	16	120 GB	18750	437	$934.4

zalando

EBS THROUGHPUT

- t2.micro, t2.small and t2.medium are showing up to ~60 MB/s on EBS

- t2.large, t2.xlarge and t2.2xlarge are showing up to ~120 MB/s on EBS

- I don't have any numbers about Max. IOPS

- But! There is no guaranteed throughput for T2 instances!

zalando

EBS TIPS

- GP2 is MUCH cheaper than IO1

- To get more than 10000 IOPS or 160MB/s with GP2 -

  build a RAID-0 from multiple volumes

- Choose an EC2 Instance with enough bandwidth

zalando

HORROR STORY

- AWS didn't provide a means to monitor EBS Burst Balance until November 2016

- RDS still doesn't provide information about GP2 Volume Burst Balance

zalando

INSTANCE STORE VOLUMES

- Pros:

  - Located on disks that are physically attached to the host computer

  - Amazing throughput and latencies compared to EBS

- Cons:

  - Provides only **temporary** block-level storage

  - Data in the instance store is lost under the following circumstances:

    - The underlying disk drive fails

    - The instance stops or terminates

zalando

PRICE COMPARISON

InstanceType	m4.xlarge	r4.xlarge	i3.xlarge	m4.2xlarge	r4.2xlarge	i3.2xlarge
vCPU	4	4	4	8	8	8
Memory	16 GB	30 GB	30 GB	32 GB	60 GB	60 GB
Max IOPS	6000	6000	6000	8000	12000	12000
Throughput (Mb/s)	93.75	109	100	125	218	200
Instance Storage (NVMe)	-	-	950 GB	-	-	1900 GB
Price (per month)	$175.2	$233.6	$271.56	$350.4	$467.2	$543.12
Price with 950 GB EBS	$288.25	$346.65		$463.45	$580.25	
Price with 1900 GB EBS	$401.3	$459.7		$576.5	$693.3	

zalando

INSTANCE STORE SUMMARY

- For high-intensive OLTP, i3 instances are a rescue:

  - r4.2xlarge + 3.3TB EBS ($863.75/month) wasn't able to keep up

 - The switch to i3.2xlarge solved all problems and saved 37% of costs

We run ~30 clusters on i3 instances and only one has failed during last 6 months.

zalando

ENHANCED NETWORKING

- Enhanced networking uses single root I/O virtualization (SR-IOV) to provide high-performance networking capabilities on supported instance types
- SR-IOV is a method of device virtualization that provides higher I/O performance and lower CPU utilization when compared to traditional virtualized network interfaces
- Enhanced networking provides higher bandwidth, higher packet per second (PPS) performance, and consistently lower inter-instance latencies

zalando

HORROR STORY

- Heavy loaded M4 instances periodically losing network
- Heavy loaded R4 instances were simply dying (terminated by AWS)
- The only visible indicator of a problem was "StatusCheckFailed" CloudWatch metric

zalando
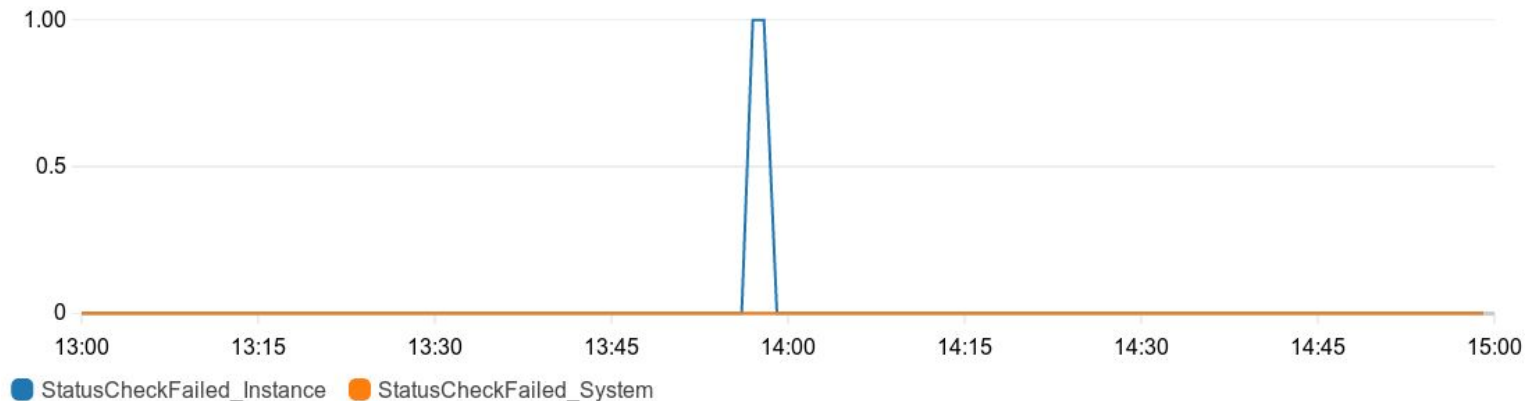

HORROR STORY

- It took us several days of investigating:

    - Thank you AWS support for pointing to an outdated **ixgbevf** driver

    - The rest we figured out on our own

- Our AMI is built on Ubuntu 14.04:

    - Ubuntu 14.04 has an outdated driver **ixgbevf**

    - Ubuntu 14.04 doesn't have an **ena** driver

zalando

ENABLING ENHANCED NETWORKING

1. AMI must contain drivers (linux kernel module)

   a. **lxgbevf** for C3, C4, D2, I2, R3, and M4 (excluding m4.16xlarge)

   b. **ena** for F1, I3, P2, R4, X1, and m4.16xlarge

2. You have to explicitly enable enhanced networking for an AMI or a

   specific instance. If you use AMI from AWS it's already enabled.

INTEL 82599 VF

- Verify that the *ixgbevf* module is installed

```
[ec2-user ~]$ modinfo ixgbevf
filename:       /lib/modules/3.10.48-55.140.amzn1.x86_64/kernel/drivers/amazon/ixgbevf/ixgbevf.ko
version:        2.14.2
```

- Check that support is enabled on Instance level

```
$ aws ec2 describe-instance-attribute --instance-id instance_id --attribute sriovNetSupport
```

- Or support is enabled on AMI level

```
$ aws ec2 describe-image-attribute --image-id ami_id --attribute sriovNetSupport
```

If the attribute isn't set, SriovNetSupport is empty; otherwise, it is set as follows:

```
"SriovNetSupport": {
    "Value": "simple"
},
```

zalando

ENA

- Verify that the *ena* module is installed

```
[ec2-user ~]$ modinfo ena
filename:     /lib/modules/4.4.11-23.53.amzn1.x86_64/kernel/drivers/amazon/net/ena/ena.ko
version:      0.6.6
```

- Check that support is enabled on Instance level

```
$ aws ec2 describe-instances --instance-id instance_id --query 'Reservations[].Instances[].EnaSupport'
```

- Or support is enabled on AMI level

```
$ aws ec2 describe-images --image-id ami_id --query 'Images[].EnaSupport'
```

If the attribute is set, the response is **true**

zalando

VERIFY THAT THE MODULE IS IN USE

[ec2-user ~]$ **ethtool -i eth*0***
driver: **vif**
version:
firmware-version:
bus-info: vif-0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no

[ec2-user ~]$ **ethtool -i eth*0***
driver: **ixgbevf**
version: 2.14.2
firmware-version: N/A
bus-info: 0000:00:03.0
supports-statistics: yes
supports-test: yes
supports-eeprom-access: no
supports-register-dump: yes
supports-priv-flags: no

[ec2-user ~]$ **ethtool -i eth*0***
driver: **ena**
version: 0.6.6
firmware-version:
bus-info: 0000:00:03.0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no

zalando

SUMMARY

- Start with small Instances and Volumes, it's easy to scale up later

- Some of the resources (**CPUCreditUsage**, **CPUCreditBalance**, **BurstBalance**) it's possible to monitor only with CloudWatch

- Always do backups and test them
